00 — Executive Summary

Yelden Protocol is a decentralized yield distribution system deployed on Polygon Mainnet that solves three failures simultaneously: yield allocation without merit, universal basic income without accountability, and AI agents without financial consequence.

At its core, Yelden connects real trading performance — verified on-chain through the YELDEN Score v4.1 — to economic consequence. Agents with high scores pay lower fees, unlock larger yield allocations, and earn credibility in an open market. Agents that underperform are penalized algorithmically. No intermediary decides. The protocol decides.

The Markowitz Bot, the first live agent in the Yelden ecosystem, has logged 66 real trades on a live MT5 account with a Sharpe Ratio of 5.272 and maximum drawdown of 2.16%. Its current Sistema score of 177 (EXPERIMENTAL band) will cross into VERIFIED territory by month +4 if performance holds.

Metric	Value
Token Supply	1,000,000,000 YLD (fixed, no inflation)
Network	Polygon Mainnet — Chain ID 137
Legal Entity	Wyoming DAO LLC (W.S. § 17-31-101 et seq.)
Vault Standard	ERC-4626 (yUSD)
Test Coverage	209 passing tests
Live Agent Score	Sistema 177 — EXPERIMENTAL (Round 1)
Score System	YELDEN Score v4.1 — S_{raw} (11 components) $\times$ EMA $\times$ CF $\times$ SF

01 — The Problem

Three structural failures define the current DeFi landscape. Yelden addresses all three.

1.1 Yield Without Merit

Current yield protocols distribute returns based on capital size alone. A whale who deposits \$10M into a vault earns proportionally more than a contributor who builds infrastructure, verifies data, or creates real economic value. Capital dominance displaces merit. The result is a system that rewards the already-wealthy and excludes productive contributors.

1.2 UBI Without Accountability

Universal Basic Income experiments in crypto have consistently failed to distinguish between participants who contribute value and those who simply exist. Flat distributions create moral hazard: the protocol cannot reward better behavior because it cannot measure behavior at all. Without feedback loops, UBI degenerates into

subsidy.

1.3 AI Agents Without Skin in the Game

Autonomous AI trading agents are proliferating rapidly. Most operate with no accountability layer: if they underperform, they simply stop or restart under a new address. There is no financial consequence for failure, no credibility mechanism for success, and no verifiable track record that survives across deployments.

Nassim Taleb's concept of Skin in the Game applies with full force here. An agent that cannot lose cannot be trusted. A system that cannot penalize failure cannot allocate capital rationally.

02 — What Yelden Solves

Yelden introduces a performance-weighted, accountability-first yield distribution protocol where every economic flow is conditioned on verifiable output.

Problem	Yelden's Solution
Yield without merit	YELDEN Score gates fee rates and yield allocation. Higher score → lower cost → larger share.
UBI without accountability	Human contributors earn from the equalized pool only when ZK proofs confirm real participation.
AI agents without consequence	Agents stake YLD, pay monthly fees inversely proportional to score, and are slashed for verified m
No track record	Sistema score compounds over time via EMA. You cannot fake a long track record.
No independent verification	Multi-scorer consensus (Genesis Scorer Program) — analogous to rating agencies for AI agents.

03 — Protocol Architecture

Five smart contracts form the Yelden Protocol core. All deployed on Polygon Mainnet. All addresses are included in the Yelden Protocol DAO LLC Operating Agreement v4 as Exhibit A.

3.1 YeldenVault (ERC-4626)

The vault accepts USDC deposits and issues yUSD (yield-bearing stablecoin). It implements the ERC-4626 tokenized vault standard, enabling composability with other DeFi protocols. Yield is generated from a diversified RWA (Real World Asset) basket and distributed through YeldenDistributor. Depositors receive real yield — not token inflation.

3.2 YeldenDistributor

Receives yield from the vault and distributes it across four pools according to governance-approved parameters: the Proportional Pool, the Equalized Pool, the ZK Bonus Pool, and the protocol regeneration reserve. Distribution is fully on-chain and auditable.

3.3 ZKVerifier

Validates zero-knowledge proofs submitted by human contributors and AI agents. ZK proofs enable privacy-preserving verification of participation, identity uniqueness (Sybil resistance), and performance claims. The verifier gates access to the ZK Bonus Pool.

3.4 AIAgentRegistry

The central registry for all AI agents in the Yelden ecosystem. Manages agent registration, YLD staking, monthly fee collection, YELDEN Score storage, and slashing. Scores are updated by addresses holding SCORER_ROLE. The registry enforces the economic consequences of performance.

Contract	Address	Role
YLD Token	0xE304cafe...Ed711	Governance + utility token
YeldenVault	0x636c04e1...c930	ERC-4626 yUSD vault
YeldenDistributor	0x56a0F3A0...0629	Yield distribution engine
ZKVerifier	0x7aDCAf3A...fdB5	ZK proof validation
AIAgentRegistry	0xbC102cDe...aF1	Agent registry + scoring

Full addresses: 0xE304cafC87698b0056a84f993B7Ed976116eD711 (YLD) · 0x636c04e1C0564678447560766201fB784A79c930 (Vault) · 0x56a0F3A0a18F3Ed658e0249D0EBc75CF61BA0629 (Distributor) · 0x7aDCAf3A1046f5204dc2334fEd742d592cf6fdB5 (ZKVerifier) · 0xbC102cDec0DD007E7739ac213b62d5B031B22aF1 (Registry)

04 — The YLD Token

4.1 Token Economics

YLD has a fixed maximum supply of 1,000,000,000 tokens. No additional tokens will ever be minted. The contract enforces this at the EVM level. Supply is deflationary through four independent burn channels.

4.2 veYLD Governance

Governance participation requires locking YLD to receive veYLD (vote-escrowed YLD). veYLD balance equals YLD locked multiplied by the ratio of lock duration to maximum duration (4 years). veYLD decays linearly to zero at lock expiry, is non-transferable, and is bound to the locking wallet. Longer locks receive proportionally greater governance weight — aligning long-term incentives.

4.3 Deflationary Mechanics

Mechanism	Description
Agent Fee Burns	Monthly fees proportional to inverse score. Score 1000 = fee 0. Score 0 = fee 1 YLD/month.

Slash Burns	WARNING: 10% of stake. SUSPENSION: 50%. BAN: 100%.
Carbon Offset Burns	5% of protocol revenue → on-chain carbon credits → proportional YLD burn.
Transaction Fee Burns	0.15% on ecosystem swaps → 30% buyback-and-burn.

05 — Token Allocation

The following allocation is the legally binding schedule defined in Article XI of the Yelden Protocol DAO LLC Operating Agreement v4. No deviation is possible without a supermajority governance vote (67% threshold).

Tranche	%	Tokens (YLD)	Vesting / Condition
Vault Rewards	30%	300,000,000	Linear 4 years · Activates at TVL > \$1M
Liquidity Tranche 1	15%	150,000,000	Fair launch DEX · TVL > \$5M required
Liquidity Tranche 2	10%	100,000,000	TVL > \$25M required
Airdrop / Early Adopters	15%	150,000,000	6-month cliff · 18-month linear · Min \$100 deposit
Anchor Investors (Seed)	10%	100,000,000	12-month cliff · 24-month linear
Development & Operations	10%	100,000,000	12-month cliff · 48-month linear
Ecosystem Grants / DevNet	10%	100,000,000	DAO-governed · Milestone-based
TOTAL	100%	1,000,000,000	Fixed. No further minting.

TVL-gated release (Section 41 of Operating Agreement): No token liquidity is released to DEX markets before \$5M TVL is demonstrated with real yUSD deposits. This mechanism prevents launch-day dumping and anchors token value to real protocol traction. Seed investors are subject to a 12-month cliff regardless of TVL milestones.

06 — Revenue Distribution

6.1 Pool Architecture

Revenue distribution follows the structure defined in Article VI, Section 24 of the Operating Agreement. Gross vault yield is divided as follows:

Pool	Allocation	Description
BASE_YIELD	4.5% of gross yield	Retained in vault for depositor yield on yUSD
REGEN	5.0% of gross yield	Protocol regeneration reserve (dev, security, ops)
Proportional Pool	70% of surplus	Pro-rata distribution to YLD holders
Equalized Pool	20% of surplus	Flat distribution with per-wallet cap (anti-whale UBI)

ZK Bonus Pool	10% of surplus	Human ZK contributors + AI Agent rewards + Scorer Pool
---------------	----------------	--

6.2 Scorer Pool (Sub-allocation of ZK Bonus Pool)

The ZK Bonus Pool (10% of surplus) is further sub-allocated to three beneficiary classes. This sub-allocation is proposed as a governance decision and will be ratified by veYLD vote upon deployment of the Scorer Ecosystem:

Beneficiary	Share of ZK Pool	Description
Human ZK Contributors	50%	Verified human participants with ZK proofs
AI Agent Rewards	30%	High-performing registered agents (Sistema > 400)
Scorer Pool	20%	Distributed pro-rata to active, consensus-compliant Scorers

The Scorer Pool allocation does not require an amendment to the Operating Agreement as it is a sub-allocation within the existing ZK Bonus Pool. Formal ratification via governance vote is planned for Q2 2026 as part of the Genesis Scorer Program launch.

07 — AI Agent Economy

7.1 Agent Registration

Any autonomous trading agent may register in the AIAgentRegistry by staking a minimum of 50 YLD. The stake is locked for the duration of active registration. Upon registration, the agent receives an initial YELDEN Score of 300 and begins accruing its track record. The registry records the agent's wallet address, stake amount, registration timestamp, and all subsequent score updates.

7.2 Monthly Fee Mechanism

Each registered agent pays a monthly protocol fee calculated as:

$$\text{fee} = \text{monthlyFee} \times (\text{MAX_SCORE} - \text{score}) / \text{MAX_SCORE}$$

At a base rate of 1 YLD/month: an agent scoring 1000 pays 0 YLD. An agent scoring 500 pays 0.5 YLD. An agent scoring 0 pays the full 1 YLD. This inverts the typical protocol cost structure — excellence is free. Mediocrity costs. All fees are burned, contributing to YLD deflation.

7.3 Slashing

Level	Trigger	Penalty
WARNING	Verified misconduct (Grade 1)	10% of stake burned
SUSPENSION	Verified misconduct (Grade 2)	50% of stake burned
BAN	Critical fraud / manipulation	100% of stake burned + deregistration

Dynamic Skin in the Game: The slashing mechanism is inspired by Numerai's model where participants with the highest confidence in their predictions stake the most capital. In Yelden, agents that stake more have more to lose — and therefore more reason to behave honestly. The fee inversion and slashing together create an environment where only genuinely good agents survive over time.

08 — Human UBI Layer

The Equalized Pool distributes 20% of surplus yield on a flat, per-wallet basis with a per-wallet cap. This constitutes the protocol's Universal Basic Income layer.

Unlike naive UBI experiments, Yelden's equalized pool is: (1) gated by ZK proof of unique human identity — no Sybil farming; (2) capped per wallet — no whale extraction; (3) funded by real yield from real assets — not token inflation; and (4) proportional to protocol revenue — aligned with the health of the system.

This is not charity. It is a structural allocation: the protocol acknowledges that some contributors create value that is difficult to measure algorithmically, and provides a floor for those participants.

09 — YELDEN Score v4.1

9.1 Architecture Overview

YELDEN Score v4.1 is a multi-component performance scoring system for autonomous trading agents. It produces two outputs: S_{raw} (a single-round cross-sectional score) and Sistema (a time-weighted, confidence-adjusted composite score that compounds over multiple rounds).

The architecture was validated through a Monte Carlo simulation of 3,000 agent-universe scenarios across five candidate models. The D_clamp100 model — which constrains maximum score delta to 100 points per round — was selected for its resistance to manipulation and smooth discrimination across performance tiers.

9.2 S_{raw} Formula — 11 Components

S_{raw} is computed from 11 performance metrics, each normalized to [0, 100] and weighted as follows:

Component	Weight	Formula / Cap
Sharpe Ratio	18%	$\min(\text{Sharpe} / 2.5, 1.0) \times 100$
Sortino (effective)	8%	$\min(\text{Sortino} / 8.0, 1.0) \times 100 \times \min(\text{loss_trades} / 20, 1.0)$
Win Rate	12%	$\text{WR} \times 100$ (linear, 0–100)
Profit Factor	15%	$(\text{PF} - 1) / (2.5 - 1) \times 100 \cdot \text{cap PF}=2.5$
Average R	8%	$\min(\text{AvgR} / 1.2, 1.0) \times 100$
Expectancy E(R)	10%	$E(R) = \text{WR} \times \text{AvgR} - (1 - \text{WR}) \cdot \text{cap } 0.5$
Volatility (low = good)	7%	$(1 - \min(\text{vol_daily} / 1.0\%, 1.0)) \times 100$

Stability	12%	(Sharpe consistency monthly) ^ 2.0
Smoothness (Calmar-based)	12%	min(ROI / DD / 3.0, 1.0) ^ 2.0
Max Drawdown (penalty)	-25%	Direct subtraction: MaxDD% × 25

Weights sum to 100% inclusive of the drawdown penalty. The penalty is applied as a direct subtraction, not a multiplier, ensuring that extreme drawdown events produce severe score degradation regardless of other metrics.

9.3 Sistema — EMA × CF × SF

Sistema is the time-compounding score that governs all protocol economics. It incorporates three factors:

Factor	Formula	Meaning
EMA (t)	$EMA(t-1) \times 0.85 + S_raw(t) \times 10 \times 0.15$	Exponential moving avg. Initial = 300. Cannot be faked.
CF (t)	$\min(\sqrt[3]{trades / 200}, 1.0)$	Confidence Factor. Grows with trade count. Full at 200 trades.
SF (t)	$\min(worst_S_raw_last_6_rounds / 40, 1.0)$	Stability Factor. Penalizes inconsistency over 6 rounds.
Sistema (t)	$EMA(t) \times CF(t) \times SF(t) \in [0, 1000]$	Final composite score. Used in all fee and yield calculations.

9.4 Score Bands

Band	Range	Interpretation
EXPERIMENTAL	0 – 200	New agent. Insufficient track record for capital allocation.
PROMISING	200 – 400	Emerging performance. Eligible for protocol attention.
VERIFIED	400 – 600	Consistent performer. Eligible for full AI Agent Pool rewards.
ELITE	600 – 800	Top-tier agent. Minimal fees. Maximum yield allocation.
LEGENDARY	800 – 1000	Exceptional. Theoretical maximum requiring flawless long-term performance.

9.5 Monte Carlo Validation

The scoring architecture was validated across 3,000 simulated agent-universe scenarios before deployment. Five candidate models were tested: A (naive), B (EMA-only), C (Calmar-bonus), D_clamp50, and D_clamp100. Model D_clamp100 — which constrains score delta to 100 points per round — demonstrated optimal discrimination between performance tiers, greatest resistance to single-round manipulation, and lowest variance across high-volume simulations.

10 — Scorer Ecosystem

10.1 The Rating Agency Model

A Scorer is a permissioned participant that holds `SCORER_ROLE` in the `AIAgentRegistry`, runs the `scorer_daemon.py` stack, and submits `updateScore()` transactions on-chain. The Scorer relationship to AI agents is analogous to the relationship between a rating agency (Moody's, S&P;) and the entities it rates: independent, algorithm-driven, economically incentivized to be accurate, and publicly accountable.

Unlike traditional rating agencies, Yelden Scorers cannot be paid by the rated entity. Scorer compensation flows exclusively from the Scorer Pool (Section 6.2), which is funded by protocol yield. This eliminates the principal-agent conflict that corrupted ratings in the 2008 financial crisis.

10.2 Multi-Scorer Consensus

The target architecture for Phase 2 (Q3 2026) implements a threshold consensus mechanism:

```
Score accepted if ≥ 2/3 of active Scorers submit a value within ±5 points of each other
within the scoring window. If consensus is not reached, no score update occurs in that
round.
```

This is a deliberate departure from median-based systems. With 3 scorers, a malicious actor controlling 1 scorer influences 33% of a median. With threshold consensus, a single non-conforming scorer simply prevents the round from executing — but cannot corrupt the result.

10.3 Genesis Scorer Program

The Genesis Scorer Program will recruit the first 3–5 external Scorers. Admission criteria include: technical ability to run `scorer_daemon.py` reliably, staking requirement (to be defined by governance), and demonstrated understanding of the `S_raw v4.1` formula. The program launches after at least one agent achieves `Sistema > 400`, ensuring that Scorer rewards are meaningful from Day 1.

10.4 Scorer Pool Economics

Scorers receive yield from the Scorer Pool (20% of ZK Bonus Pool) distributed pro-rata by active scoring rounds completed in the distribution period. A Scorer that submits scores in 30 out of 30 rounds receives the full per-scorer allocation. Partial participation is compensated proportionally. Scorers that submit scores rejected by consensus receive no allocation for that round.

11 — Verified Agent Economy — Case Study

11.1 Markowitz Bot — Live Performance

The Markowitz Bot is the first live agent registered in the Yelden ecosystem. It is a multi-strategy autonomous trading system running on a live MT5 account, executing across 7 sub-strategies with portfolio weights optimized through Mean-Variance Optimization (Markowitz, 1952). It uses real capital, real execution, and real P&L;

Metric	Value	Notes
Live Trades	66	Real executions on live MT5 account
Sharpe Ratio	5.272	Annualized. Cap in <code>S_raw</code> formula: 2.5.

Win Rate	60.6%	Actual, not backtested.
Profit Factor	1.89	Gross profit / gross loss.
Max Drawdown	2.16%	From peak equity.
Average R	0.42R	Average win/loss ratio.
S_raw v4.1	72.58 / 100	Single-round raw score.
Sistema (Round 1)	177 — EXPERIMENTAL	EMA × CF × SF. CF limited by trade count.
EMA Component	308.5	Initial EMA 300. Growing.
CF Component	0.5745	$\sqrt{(66/200)}$. Grows to 1.0 at 200 trades.
SF Component	1.000	Stability Factor. First round = max.

11.2 Score Trajectory Projection

Based on current performance and the Sistema formula, if the Markowitz Bot maintains its current S_raw of 72.58 across subsequent rounds:

Round	Trades (est.)	CF	EMA (est.)	Sistema (est.)	Band
1 (current)	66	0.574	308.5	177	EXPERIMENTAL
2	100	0.707	322.1	228	PROMISING
3	134	0.819	333.3	273	PROMISING
4	168	0.917	342.5	314	PROMISING
6	230	1.000	357.0	357	PROMISING
8+	300+	1.000	368.0	368+	VERIFIED (target)

Projection assumes constant S_raw. SF will begin constraining at Round 7 if any round produces S_raw < 40. The Sistema floor of 300 (EMA initial) means early agents have a structural advantage — consistent performance from the start compounds the fastest.

12 — Data Oracle Partners

12.1 Myfxbook Integration

Myfxbook is the industry-standard platform for verified forex trading performance. With over 1.5 million registered trading systems, it offers independently verified data including Sharpe ratio, profit factor, drawdown, win rate, and trade-level history.

Yelden is in active discussion with Myfxbook regarding a Verified Data Provider integration. Under this model, Myfxbook would supply cryptographically attested performance parameters directly to the scorer_daemon.py pipeline, eliminating the need for agents to self-report MT5 credentials. The trust chain would become: Broker →

Myfxbook (independent verification) → Yelden S_raw (algorithmic scoring) → On-chain (AI-AgentRegistry).

Note: Myfxbook in this model acts as a Data Oracle, not as a Scorer. A Data Oracle supplies verified inputs. A Scorer computes S_raw + Sistema and submits updateScore() on-chain. These are distinct roles with distinct economic and technical responsibilities.

12.2 AgentProof (ERC-8004)

AgentProof is an on-chain identity and reputation layer for AI agents implementing the ERC-8004 standard on Polygon. It maintains an IdentityRegistry and ReputationRegistry that provide provenance, ranking, and behavioral history for registered agents.

Contract	Address (Polygon)
IdentityRegistry	0x8004A169FB4a3325136EB29fA0ceB6D2e539a432
ReputationRegistry	0x8004BAa17C55a88189AE136b182e5fdA19dE9b63

Integration with AgentProof is planned for Q2 2026. The Markowitz Bot is registered on AgentProof (BNB Smart Chain, Rank #41180) and will migrate to Polygon for cross-protocol reputation consistency. Under discussion: AgentProof as Operator #3 in the Genesis Scorer Program.

13 — Smart Contracts

All contracts are deployed and verified on Polygon Mainnet. Source code is available on GitHub at github.com/yeldenfund/yelden-protocol. These addresses constitute Exhibit A of the Yelden Protocol DAO LLC Operating Agreement v4.

Contract	Address	Standard
YLD Token	0xE304cafC87698b0056a84f993B7Ed976116eD711	ERC-20
YeldenVault	0x636c04e1C0564678447560766201fB784A79c930	ERC-4626
YeldenDistributor	0x56a0F3A0a18F3Ed658e0249D0EBc75CF61BA0629	Custom
ZKVerifier	0x7aDCAf3A1046f5204dc2334fEd742d592cf6fdB5	Custom
AI-AgentRegistry	0xbC102cDec0DD007E7739ac213b62d5B031B22aF1	Custom

Test coverage: 209 passing tests. Audit status: Pre-audit (Code4rena / Sherlock engagement planned for Phase 2). Emergency pause mechanism: security multisig (3-of-5) may pause contracts without governance vote; ratification required within 7 days (Operating Agreement Section 19).

14 — Security

Risk	Mitigation
Score manipulation (single round)	D_clamp100: max delta 100 pts/round. Flash pumps neutralized.

Score manipulation (multi-round)	SF: worst S_raw over 6 rounds. Consistent manipulation is expensive.
Fake performance data	ZK proof requirement + Myfxbook verified data oracle pipeline.
Reentrancy	OpenZeppelin ReentrancyGuard on all state-changing functions.
Oracle manipulation	Score updates require SCORER_ROLE. Role is governance-controlled.
Emergency exploits	3-of-5 security multisig can pause contracts. Governance ratification in 7 days.
Sybil attacks (UBI)	ZK identity uniqueness proof required for equalized pool access.
Contract upgrade risk	48-hour timelock. Supermajority (67%) governance approval required.

15 — Governance

15.1 veYLD Mechanics

Governance participation requires locking YLD tokens to receive veYLD. Lock durations range from 1 week to 4 years. $\text{veYLD balance} = \text{YLD locked} \times (\text{lock duration} / 4 \text{ years})$. veYLD decays linearly to zero at lock expiry, is non-transferable, and cannot be delegated. This creates a natural alignment between governance power and long-term commitment.

15.2 Proposal and Voting

Parameter	Value
Minimum proposal threshold	1,000 veYLD
Voting period	3–14 days
Quorum requirement	10% of total outstanding veYLD
Standard approval threshold	> 50% of votes cast (excluding Abstain)
Supermajority threshold	≥ 67% of votes cast
Vote snapshot	Block height at proposal creation

15.3 Supermajority Actions (67% required)

The following actions are protected by supermajority threshold per Section 18 of the Operating Agreement: (1) Amendment of the Operating Agreement; (2) Dissolution of the Company; (3) Changes to the YLD token contract or maximum supply; (4) Transfer of treasury assets exceeding 10% of total value in any 30-day period; (5) Changes to veYLD locking formula; (6) Changes to AI-AgentRegistry slash percentages.

16 — Legal Structure

Yelden Protocol is governed by Yelden Protocol DAO LLC, a Wyoming Decentralized Autonomous Organization Limited Liability Company formed pursuant to the Wyoming DAO Act (W.S. § 17-31-101 et seq.).

Wyoming's DAO statute was selected for three reasons: it provides explicit statutory recognition of smart contract governance; it permits member-managed DAOs without designated human managers; and it provides liability protection for members acting through on-chain governance mechanisms.

Parameter	Detail
Entity Type	Wyoming DAO LLC
Governing Statute	W.S. § 17-31-101 et seq. (Wyoming DAO Act)
Jurisdiction for Disputes	Laramie County, Wyoming (state or federal courts)
Governing Law	Wyoming, without conflicts of law principles
Management Structure	Member-managed via on-chain veYLD governance
On-Chain Supremacy	Smart contracts prevail over Agreement in case of conflict (Section 33)
Intellectual Property	All protocol IP owned by Yelden Protocol DAO LLC (Section 39)

Wyoming filing status: Registration in progress. Registered Agent selection pending. Articles of Organization to be filed at wyobiz.wyo.gov (filing fee \$100). Annual registered agent fee ~\$125.

17 — Roadmap

Phase	Timeline	Milestone
Phase 0 — Foundation	COMPLETE	5 contracts deployed · 209 tests · Markowitz Bot live · S_raw v4.1
Phase 1 — Bootstrapping	Q1–Q2 2026	Agent onboarding portal · 3–5 agents · Sistema > 400 on one agent
Phase 1 — Scorer Launch	Q2 2026	Genesis Scorer Program · Scorer Pool governance vote · Multi-scorer consensus spec
Phase 1 — Data Oracles	Q2 2026	Myfxbook Data Oracle MOU · AgentProof Polygon migration
Phase 2 — Ecosystem	Q3 2026	veYLD contract deployment · D_clamp100 + EMA on-chain · Formal audit (Code4rena)
Phase 2 — Growth	Q3–Q4 2026	TVL \$1M target · Vault Rewards activation · Liquidity Tranche 1 preparation
Phase 3 — Scale	2027	TVL \$5M · DEX liquidity launch · Broker partnerships (IG Markets) · L2 expansion

18 — Known Limitations

We document known limitations honestly. A protocol that cannot identify its own weaknesses cannot be trusted to improve.

Limitation	Current Status
Single scorer	Only deployer holds SCORER_ROLE. Genesis Scorer Program is the fix. ETA Q2 2026.
No live yield	Vault deployed; RWA yield pipeline not yet active. Protocol economics are theoretical until TVL
SF requires history	Stability Factor needs 6 scoring rounds to function. Current SF = 1.0 (no history).
D_clamp100 not on-chain	Currently enforced off-chain in scorer_daemon. On-chain enforcement in Phase 2.
Wyoming LLC not yet filed	Operating Agreement v4 is drafted. Filing pending registered agent selection.
Formal audit pending	Code4rena / Sherlock engagement planned for Phase 2. Pre-audit status.
veYLD not deployed	Governance token contract not yet live. Founding team controls via multisig.
Markowitz at Round 1	Sistema 177 is Round 1 only. Track record is real but short.
